Department of Artificial Intelligence and Data Science

ASSESSMENT TOOL 3 – CODING CHALLENGE

Course Code:	DSA03	Course Title:	Natural Language Processing
CO Assessed:	CO1 – Imitation (L1)	Assessment:	Assessment Tool 3 – Coding Challenge
Weightage:	30% of CIA		
CO5 Statement:	Analyse NLP models, regular expression patterns, finite state automata, morphological processing techniques and to interpret language processing. (BL-3)		
Student Name:	P DILLI BABU	Reg. No.:	192472284
Section / Batch:	2024	Date:	

Code of Conduct

I P DILLI BABU(192472284) (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: p dilli babu

Instructions

- Develop a complete and modular Python program that meets all the functional requirements specified in the coding challenge using appropriate algorithms, data structures, and programming practices.
- Test the program using multiple valid and invalid test cases, and clearly display the input, processing, and output to verify the correctness of the implementation.
- Follow standard coding practices by using meaningful variable names, proper indentation, comments, exception handling (where applicable), and upload the source code, sample outputs, and README file to the designated GitHub repository.
- Duration: 40 minutes.

Section / Topic	Focus	Q Nos
Regular Expression Pattern Matching	Regular Expressions, Basic Regular Expression Patterns	1
Finite State Automata Implementation	Finite State Automata, Models and Algorithms	2
Advanced Regular Expression Search	Regular Expressions, Basic Regular Expression Patterns	3

Section 1: Intelligent Email and Password Validator using Regular Expressions

1. Problem Statement:

A software company is developing a user registration system. Before creating an account, the system must validate user credentials based on predefined security policies.

Develop a Python application that validates:

Email Address

Password

Mobile Number

using Regular Expressions.

Validation Rules

Email

Must start with an alphabet.

May contain letters, digits, '!', '_' before '@'.

Domain should contain only alphabets.

Valid extensions: .com, .org, .edu, .net, .in

Password

Minimum 8 characters

At least one uppercase letter

At least one lowercase letter

At least one digit

At least one special character (@, #, \$, %, &, !)

Mobile Number

Must contain exactly 10 digits.

First digit should be between 6–9.

Expected Output

Display:

Valid Email / Invalid Email

Strong Password / Weak Password

Valid Mobile Number / Invalid Mobile Number

```
1 import re
2 email = input("Enter Email: ")
3 password = input("Enter Password: ")
4 mobile = input("Enter Mobile Number: ")
5 e = r"^[A-Za-z][A-Za-z0-9._]*@[A-Za-z]+\.(com|org|edu|net|in)$"
6 p = r"^(?=.*[A-Z])(?=.*[a-z])(?=.*\d)(?=.*[@#%&!]).{8,}$"
7 m = r"^[6-9]\d{9}$"
8 print("\n--- Validation Result ---")
9 print("Email:", "Valid Email" if re.match(e, email) else "Invalid Email")
10 print("Password:", "Strong Password" if re.match(p, password) else "Weak Password")
11 print("Mobile:", "Valid Mobile Number" if re.match(m, mobile)
12         else "Invalid Mobile Number")
13
```

Output

```
Enter Email: student@university.sec
Enter Password: dilli@123
Enter Mobile Number: 9491693835

--- Validation Result ---
Email: Invalid Email
Password: Weak Password
Mobile: Valid Mobile Number
```

Section 2: Design a Finite State Automata (FSA) Simulator

2. Problem Statement

Develop a Python-based Deterministic Finite Automata (DFA) simulator.

The program should:

- Accept the DFA description
 - States
 - Input alphabet
 - Transition table
 - Initial state
 - Final state(s)
- Accept multiple input strings.
- Simulate state transitions.
- Display whether the string is Accepted or Rejected.

Example

Language:
Strings ending with "ab"

Input

abaab

Output

Transition Path:
 $q_0 \rightarrow q_1 \rightarrow q_0 \rightarrow q_1 \rightarrow q_2$
Accepted

```

1  states = ["q0", "q1", "q2"]
2  final = "q2"
3  def dfa(s):
4      state = "q0"
5      path = [state]
6      for ch in s:
7          if state == "q0":
8              state = "q1" if ch == "a" else "q0"
9          elif state == "q1":
10             state = "q2" if ch == "b" else "q1"
11          elif state == "q2":
12             state = "q1" if ch == "a" else "q0"
13             path.append(state)
14             print("Transition Path:", " -> ".join(path))
15             if state == final:
16                 print("Accepted")
17             else:
18                 print("Rejected")
19  s = input("Enter string: ")
20  dfa(s)

```

Output

```

Enter string: abaab
Transition Path: q0 -> q1 -> q2 -> q1 -> q1 -> q2
Accepted

```

Section 3: Smart Pattern Matching Engine using Regular Expressions

3. Problem Statement

Develop a Python-based text search engine that performs pattern matching using Regular Expressions.

The system should support:

- Word Search
- Prefix Search
- Suffix Search
- Date Search
- Phone Number Search
- Hashtag Search
- Mention (@username) Search

Example Input

Meeting on 12/09/2026
 Call 9876543210
 #NLP
 @OpenAI

natural language processing

User Menu

- 1.Search Date
- 2.Search Phone Number
- 3.Search Hashtag
- 4.Search Mention
- 5.Search Prefix
- 6.Search Suffix

Expected Output

Display all matching patterns based on user selection.

```
1 import re
2 text = """Meeting on 12/09/2026
3 Call 9876543210
4 #NLP
5 @OpenAI
6 natural language processing"""
7 print("1. Date")
8 print("2. Phone")
9 print("3. Hashtag")
10 print("4. Mention")
11 print("5. Prefix")
12 print("6. Suffix")
13 choice = input("Enter choice: ")
14 if choice == "1":
15     pattern = r"\b\d{2}/\d{2}/\d{4}\b"
16 elif choice == "2":
17     pattern = r"\b[6-9]\d{9}\b"
18 elif choice == "3":
19     pattern = r"#\w+"
20 elif choice == "4":
21     pattern = r"@w+"
22 elif choice == "5":
23     word = input("Enter prefix: ")
24     pattern = r"\b" + re.escape(word) + r"\w*"
25 elif choice == "6":
26     word = input("Enter suffix: ")
27     pattern = r"\w*" + re.escape(word) + r"\b"
28 else:
29     print("Invalid choice")
30     exit()
31 result = re.findall(pattern, text, re.IGNORECASE)
32 print("\nMatching Patterns:")
33 for x in result:
34     print(x)
35 print("Total:", len(result))
```

Output

1. Date
2. Phone
3. Hashtag
4. Mention
5. Prefix
6. Suffix

Enter choice: 1

Matching Patterns:

12/09/2026

Total: 1

Rubrics for Calculation

Criteria	Weightage	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Problem Understanding	20%	Clearly understands problem constraints, edge cases, and competitive requirements	Understands problem with minor gaps in constraints	Partial understanding; misses key constraints	Misinterprets problem or constraints
Algorithm	25%	Selects optimal algorithm with best time and space complexity for competitive constraints	Uses efficient algorithm with minor scope for improvement	Uses basic/inefficient approach	No clear algorithmic approach
Code Implementation	20%	Writes correct, efficient, and clean code that passes all constraints	Code works with minor errors or inefficiencies	Partially correct code; fails for some cases	Code does not execute or gives incorrect results
Competitive Performance	20%	Solves problem within time limits and handles large inputs effectively	Solves within acceptable time with minor delays	Struggles with time limits or larger inputs	Unable to solve within time constraints
Test Case Handling	15%	Handles all test cases including edge and hidden cases	Handles most test cases	Misses important edge cases	Fails on multiple test cases

Q. No. / Criteria	Problem Understanding	Algorithm	Code Implementation	Competitive Performance	Test Case Handling	Sub. Total	Total %
